

Good morning all.

Below are the summarized results of the variety trial at the Syngenta site in Arva.

	No Fung	Fung
r29	103.7	136.6
moon	95.6	125.9
r65	88.1	126.6
grow08	110.0	133.2
FUZE	75.8	137.2
SWOOP	84.6	115.1
r64	62.0	120.0
BLAZE	97.6	128.5

These are 2 replicate strips, which we split when stripe rust hit. Half of the strips were sprayed at T3 (no earlier fungicide), which was a bit late for when I would have liked to spray for the stripe rust, but clearly not a disaster. You can certainly see which varieties are the most impacted by the stripe rust. Devastated might be a better term for it.

There was some Canada Thistle in small patches in this trial, I don't think it had a huge impact and it turned out to be fairly equally distributed when spread over the two reps, but if this was a performance trial you might have thrown it out due to poor weed control.

The full dataset is available if you wish to peruse it. You are welcome to use the data, but please include all data if you do.

Thanks and have a great weekend.

Best

Peter and Shane
